A concise introductory text integrating biochemistry with physiology and cell biology and is aimed specifically at introductory health science students. Laura Batmanian, University of Sydney.

While the field of computational structural biology or structural bioinformatics is rapidly developing, there are few books with a relatively complete coverage of such diverse research subjects studied in the field as X-ray crystallography computing, NMR structure determination, potential energy minimization, dynamics simulation, and knowledge-based modeling. This book helps fill the gap by providing such a survey on all the related subjects. Comprising a collection of lecture notes for a computational structural biology course for the Program on Bioinformatics and Computational Biology at Iowa State University, the book is in essence a comprehensive summary of computational structural biology based on the author's own extensive research experience, and a review of the subject from the perspective of a computer scientist or applied mathematician. Readers will gain a deeper appreciation of the biological importance and mathematical novelty of the research in the field.

A synthesis and collation of the recent material regarding the role of the neutrophil in basic pathological processes is presented in this volume. The mechanisms of chemotaxis, secretion, phagocytosis, intracellular killing, oxygen radical production and arachidonate production are comprehensively reviewed. Stimulus response coupling in the neutrophil, with chapters on intracellular  $Ca^{2+}$ , C-Kinase, phospholipid metabolism, microfilaments and membrane electrophysiology are extensively discussed. Invaluable to graduate students and medical and scientific researchers, this book provides a unique, up-to-date account of cellular biochemistry and physiology of the neutrophil.

This book focuses on the fundamentals of plant physiology for undergraduate and graduate students. It consists of 34 chapters divided into five major units. Unit I discusses the unique mechanisms of water and ion transport, while Unit II describes the various metabolic events essential for plant development that result from plants' ability to

capture photons from sunlight, to convert inorganic forms of nutrition to organic forms and to synthesize high energy molecules, such as ATP. Light signal perception and transduction works in perfect coordination with a wide variety of plant growth regulators in regulating various plant developmental processes, and these aspects are explored in Unit III. Unit IV investigates plants' various structural and biochemical adaptive mechanisms to enable them to survive under a wide variety of abiotic stress conditions (salt, temperature, flooding, drought), pathogen and herbivore attack (biotic interactions). Lastly, Unit V addresses the large number of secondary metabolites produced by plants that are medicinally important for mankind and their applications in biotechnology and agriculture. Each topic is supported by illustrations, tables and information boxes, and a glossary of important terms in plant physiology is provided at the end.

The urgent need for rapid and reliable analytical tools suitable to perform a large number of high quality analyses of biological molecules has been dramatically stressed by the recent crisis caused by the COVID-19 pandemic.
