Asking Questions in Biology is all about scientific discovery. Biology students must be able to analyse data and produce high quality reports, but before this they need to work out exactly what it is they are trying to discover. Asking Questions in Biology begins with the often overlooked (yet crucial) skill of asking the right question, in the right way. It then moves on to present the tools and techniques required to gather data, analyse this data and finally to present this data (either orally or in a formal report).

Written by experts in the area of executive functioning, Essentials of Executive Functions Assessment equips mental health practitioners (school, clinical, developmental/pediatric, neuropsychologists, educational diagnosticians, and educational therapists) with all the information they need to administer, score, and interpret assessment instruments that test for executive functions deficits associated with a number of psychiatric and developmental disorders.

The Test Drive deals with the war perpetrated by highly determined reactionary forces on science and research. How does the government at once promote and prohibit scientific testing and undercut the importance of experimentation? To what extent is testing at the forefront of theoretical and practical concerns today? Addressed to those who are left stranded by speculative thinking and unhinged by cognitive discourse, The Test Drive points to a toxic residue of uninterrogated questions raised by Nietzsche, Husserl and Derrida. Ranging from the scientific probe to modalities of testing that include the limits of friendship or love, this work explores the crucial operations of an uncontestable legitimating machine. Avital Ronell offers a tour-de-force reading of legal, pharmaceutical, artistic, scientific, Zen, and historical grids that depend upon different types of testability, involving among other issues what it means to put oneself to the test.

"There is no shortage of literature on Einstein and relativity, yet Crelinsten succeeds in providing a novel and fruitful perspective on how Einstein's theory of general relativity was received in its early years. By focusing on the astronomers rather than the physicists, and America rather than Europe, he adds a valuable chapter to the history of modern science in which scientific and social aspects are treated equally and

in the same compelling detail."--Helge Kragh, University of Aarhus, Denmark "Jeffrey Crelinsten has written a wonderful book that fills an important gap in our knowledge of the reception and acceptance of general relativity in the scientific community: he focuses on the crucial role played by astronomers, particularly in the United States. In a fascinating account he describes how general relativity was tested and confirmed and how the new field of relativistic cosmology emerged out of this work. I wish this book had appeared earlier!"--A. J. Kox, University of Amsterdam "An excellent book, with wonderful gems that arise out of the author's mastery of the literature. It will be enormously useful to Einstein scholars as well as to those interested in the history of astronomy."--Daniel Kennefick, University of Arkansas "A fascinating and detailed story of the emergence of modern cosmology that reaches back to the debates over the validity of Einstein's theory of general relativity during the early decades of the twentieth century. This is an American tale of pragmatism and empiricism, of eclipse expeditions and of the intrepid spirit of those who built the world's largest astronomical observatories and discovered an expanding universe."--Diana Kormos Buchwald, Einstein Papers Project, Caltech "An overwhelming accomplishment that surely will have a lasting impact on the history of the subject. So much is laid to rest about the dominance of the 'Eddington' 1919 eclipse result and its resulting PR as to be an eye-opener to many (to most) would-be-historians. [Crelinsten's] research into original sources is powerful and makes the case!"-- Allan R. Sandage, Staff Astronomer Emeritus, The Observatories (Pasadena, CA) Carnegie Institution of Washington "Since the 1960s, scientists have shown with exquisite precision that Einstein was right about relativity. But for relativity's first two decades (1910-1930), the case for Einstein was hardly a slam dunk. Jeffrey Crelinsten tells the exciting roller-coaster story

of the early experimental tests of special and general relativity, from light deflection measurements to ether-drift tests. Believers debated skeptics, but in the end, the jury was swayed by the data. Crelinsten's tale reads like a scientific courtroom thriller."--Clifford Will, Washington University in St. Louis, author of Was Einstein Right?

Echinoderms, including feather stars, seastars, brittle stars, sea urchins and sea cucumbers, are some of the most beautiful and interesting animals in the sea. They play an important ecological role and several species of sea urchins and sea cucumbers form the basis of important fisheries.

Over 1000 species live in Australian waters, from the shoreline to the depths of the abyssal plain and the tropics to Antarctic waters. Australian Echinoderms is an authoritative account of Australia's 110 families of echinoderms. It brings together in a single volume comprehensive information on the identification, biology, evolution, ecology and management of these animals for the first time. Richly illustrated with beautiful photographs and written in an accessible style, Australian Echinoderms suits the needs of marine enthusiasts, academics and fisheries managers both in Australia and other geographical areas where echinoderms are studied.

This book combines recent information and discoveries in the field of human molecular biology and human molecular evolution. Although the exact prevalence of overweight and obesity are dependent upon the definition used, these conditions are generally accepted to be widespread and increasing problems by health authorities and the public in most western nations. The proportion of the UK and US populations which are overweight or obese, by any measure, has substantially risen over the past decade, and similar increases have been observed in other western nations as well as rapidly modernizing societies (Hodge et al. , 1996). The physiological, psychological, and social! environmental factors which may be implicated in the aetiology, maintenance, and treatment of these conditions have been the subject of an extraordinary volume of human and animal research,

scientific conferences, and technical and popular literature. This book focuses specifically on the role of food and eating in overeating and obesity, emphasizing the relationships between people and food which may give rise to positive energy balance, and the potential contributions of specific components, foods, or groups of foods. The intent is to integrate the psychobiological and cognitive psychological aspects of appetite, food preferences, and food selection with physiological and metabolic outcomes of eating behaviours. The ingestion of a particular quality and quantity of food is a voluntary behaviour, and that act, its determinants, features and sequelae are explored here, considering wider academic thought but guided by potential practical implications.
