International humanitarian law is the law that governs the conduct of participants during armed conflict. This branch of law aims to regulate the means and methods of warfare as well as to provide protections to those who do not, or who no longer, take part in the hostilities. It is one of the oldest branches of international law and one of enduring relevance today. The Oxford Guide to International Humanitarian Law provides a practical yet sophisticated overview of this important area of law. Written by a stellar line up of contributors, drawn from those who not only have extensive practical experience but who are also regarded as leading scholars of the subject, the text offers a comprehensive and authoritative exposition of the field. The Guide provides professionals and advanced students with information and analysis of sufficient depth to enable them to perform their tasks with understanding and confidence. Each chapter illuminates how the law applies in practice, but does not shy away from the important conceptual issues that underpin how the law has developed. It will serve as a first port of call and a regular reference work for those interested in international humanitarian law.

This book documents the advantages and limitations of various electricity generation methods. It illustrates how both electricity and motor fuel can be cost-effectively derived from coal, natural gas or other indigenous fuels, thereby eliminating our dependence on imported oil and the power of OPEC. It favours electricity generation systems powered exclusively by natural gas, coal, nuclear and renewables and motor vehicles powered by hydrogen (electricity from coal gasification with carbon capture and sequestration (CCS) and hydrogen as the fuel powering fuel-cell electric vehicles produced from natural gas or by gasifying coal With CCS.) The book also demonstrates that the US can meet the Climate Change goal of reducing all greenhouse gases by 80% below 1990 levels in both the transportation and electric utility sectors using hydrogen and coal.
