Use and development of database and expert systems can be found in all fields of computer science. The aim of this book is to present a large spectrum of already implemented or just being developed database and expert systems. Contributions cover new requirements, concepts for implementations (e.g. languages, models, storage structures), management of meta data, system architectures, and experiences gained by using traditional databases in as many areas of applications as possible (at least in the fields listed). The aim of the book is to inspire a fruitful dialogue between development in practice, users of database and expert systems, and scientists working in the field.

This compilation probably looks like one of the craziest things a human being could spend his or her time on. Yet nobody would wonder at someone taking a short walk every day - after twenty five years that person would have covered a surprisingly long distance. This is exactly the story behind this list, which appeared first as a few pages within the directory StarGuides (or whatever name it had at that time) and as a distinct sister publication since 1990. The idea behind this dictionary is to offer astronomers and

related space scientists practical assistance in decoding the numerous abbreviations, acronyms, contractions and symbols which they might encounter in all aspects of the vast range of their professional activities, including traveling. Perhaps it is a bit paradoxical, but if scientists quickly grasp the meaning of an acronym solely in their own specific discipline, they will probably encounter more difficulties when dealing with adjacent fields. It is for this purpose that this dictionary might be most often used. Scientists might also refer to this compilation in order to avoid identifying a project by an acronym which already has too many meanings or confused definitions.

A software crisis occurs where the gap between the demand for new complex software systems and the actual supply has rapidly increased. This book argues that reusing software can be a major factor in alleviating these problems. The text covers the principles, approaches, support systems, methodologies and real cases in software reuse practice. It discusses the implications of reuse for the software life-cycle and the concerns of software engineering and management. It also considers organization issues: retrieval specification and the reorganization of components. Document-oriented versus object-oriented approaches to reuse are described in detail. Legal issues are discussed with relation to both patent and copyright law.

This book constitutes the thoroughly refereed post-proceedings of the 4th International Workshop on Distributed Communities on the Web, DCW 2002, held in Sydney, Australia in April 2002. The 25 revised full papers presented together with an introductory overview and outline of the field were carefully reviewed and selected from 59 submissions. The papers are organized in topical sections on adaptive networks, collaborative systems, languages for the Web, and adaptive distributed systems.

The number of new applications in need of database support is exploding and there is an increasing need to link and access database systems supporting these new applications via computer networks. End-users and non-computer experts are becoming heavily involved in the set-up, management and use of database systems and this book provides the important database design methodologies and implementation technology which should be available for them as well as for computer experts.

A detailed introduction to interdisciplinary application area of distributed systems, namely the computer support of individuals trying to solve a problem in cooperation with each other but not necessarily having identical work places or

working times. The book is addressed to students of distributed systems, communications, information science and socio-organizational theory, as well as to users and developers of systems with group communication and cooperation as top priorities.
