In 2001, Jim O'Neill predicted the fastest growing economies of the past decade. Now he's back to explore the new growth markets we should all be watching closely today. It's been ten years since Jim O'Neill conceived of the BRIC acronym. He and his team made a startling prediction: Four developing nations- Brazil, Russia, India, and China (the BRICs)-would overtake the six largest Western economies within forty years. The BRIC analysis permanently changed the world of global investing, and its accuracy has stood the test of time. The Growth Map features O'Neill's personal account of the BRIC phenomenon, how it has evolved, and where those four key nations currently stand after a turbulent decade. And the book also offers an equally bold prediction about the "Next Eleven" countries: Bangladesh, Egypt, Indonesia, Iran, Mexico, Nigeria, Pakistan, Philippines, South Korea, Turkey, and Vietnam. These developing nations may not seem exceptional today, but they offer exciting opportunities for investors over the next decade, just as BRIC did before them. O'Neill also shares several compelling insights about the world economy. He reveals the value for growing countries in being "willing to play" by meaningfully committing to policies that encourage further growth and engagement with globalization. He explains how the G20 can adjust to better incorporate the BRICs and to better reflect the balance of the global economy. Finally, O'Neill makes the counterintuitive claim that good things can quite often come from crises. While established economic powers may see the rise of the BRICs as a threat, international trade benefits us all over the long term. Likewise, the recent financial crisis revealed deep problems in our economic systems, problems we now have the opportunity to fix. A work of astute and absorbing analysis, The Growth Map is an indispensable guide for every investor and every participant in the global economy. Anyone who wants to understand the developing world would do well to heed the man called "one of the most sought-after economic commentators on the planet." (The Telegraph)

The green revolution led to the development of improved varieties of crops, especially cereals, and since then, classical or molecular breeding has resulted in the creation of economically valuable species. Thanks to recent developments in genetic engineering, it has become possible to introduce genes from different sources, such as bacteria, fungi, viruses, mice and humans, to plants. This technology has made the scientific community aware of the critical role of transgenics, not only as a means of producing stress tolerant crops but also as a platform for the production of therapeutics through molecular farming. This book discusses the commercial applications of plant transgenic technologies, including the use of transgenic cell culture approaches to improve the production of metabolites and high-value therapeutics as well as transgenic plants in pest management. It also explores generation of novel vectors, protein production using chloroplast engineering and the latest developments in this area, such as genome editing in plants. Featuring general discussions and research papers by leading international experts, it is a valuable resource for scientists, teachers, students and industrialists working in the field.

This book provides much new thinking on the phenomenon of whole-person education, a phenomenon which features strongly in East Asian universities, and which aims to develop students intellectually, spiritually, and ethically, to master critical thinking skills, to explore ethical challenges in the surrounding community, and to acquire a broad based foundation of knowledge in humanities, society, and nature. The book considers different approaches to whole person education, including Confucian, Buddhist, and Chinese perspectives, Western philosophy, and religion and interdisciplinary approaches. Overall, the book provides a comprehensive overview of whole person education, why it matters and how to implement it. Moreover, although the examples in the book are from East Asia, the discussion and the values involved are universal, important for the whole world.

Tropical Radioecology is a guide to the wide range of scientific practices and principles of this multidisciplinary field. It brings together past and present studies in the tropical and sub-tropical areas of the planet, highlighting the unique aspects of tropical systems. Until recently, radioecological models for tropical environments have depended upon data derived from temperate environments, despite the differences of these regions in terms of biota and abiotic conditions. Since radioactivity can be used to trace environmental processes in humans and other biota, this book offers examples of studies in which radiotracers have been used to assess biokinetics in tropical biota. Features chapters, co-authored by world experts, that explain the origins, inputs, distribution, behaviour, and consequences of radioactivity in tropical and subtropical systems. Provides comprehensive lists of relevant data and identifies current knowledge gaps to allow for targeted radioecological research in the future. Integrates radioecological information into the most recent radiological consequences modelling and best-practice probabilistic ecological risk analysis methodology, given the need to understand the implications of enhanced socio-economic development in the world's tropical regions.

Does your real age match the age you feel? When do we reach middle age? When, if ever, are we old? The way we age and the way we perceive age has changed radically. As we embrace new experiences, relationships and gadgets, we barely stop to look at our watches let alone consider whether our behaviour is 'age appropriate'. In this provocative and timely book, Catherine Mayer looks at the forces that created amortality - the term she coined to describe the phenomenon of living agelessly. As she follows this social epidemic through generations and across continents, she reveals its profound impact on society, our careers, our families and ourselves. Why be defined by numbers? Are you amortal?

The numerical simulation of sheet metal forming processes has become an indispensable tool for the design of components and their forming processes. This role was attained due to the huge impact in reducing time to market and the cost of developing new components in industries ranging from automotive to packing, as well as enabling an improved understanding of the deformation mechanisms and their interaction with process parameters. Despite being a consolidated tool, its potential for application continues to be discovered with the continuous need to simulate more complex processes, including the integration of the various processes involved in the production of a sheet metal component and the analysis of in-service behavior. The quest for more robust and sustainable processes has also changed its deterministic character into stochastic to be able to consider the scatter in mechanical properties induced by previous manufacturing processes. Faced with these challenges, this Special Issue presents scientific advances in the development of numerical tools that improve the prediction results for conventional forming process, enable the development of new forming processes, or contribute to the integration of several manufacturing processes, highlighting the growing multidisciplinary characteristic of this field.

There are many variables of territoriality available to national courts under contemporary international law. Does the same apply to the International Criminal Court? And if so, what are the limits to the teleological expansion of the Court's territorial jurisdiction as regards, for example, partial commission of a crime in State not Party territory, crimes committed over the internet or crimes committed in occupied territories? Michael Vagias's analysis of the law and procedure surrounding the territorial jurisdiction of the Court examines issues such as the application of localisation theories of territoriality and the means of interpretation for article 12(2)(a); the principle of legality (*nullum crimen sine lege*) and human rights law for the interpretation of jurisdictional provisions; *compétence de la compétence*; crimes committed over the internet; and the procedure for jurisdictional objections.

Virus bioinformatics is evolving and succeeding as an area of research in its own right, representing the interface of virology and computer science. Bioinformatic approaches to investigate viral infections and outbreaks have become central to virology research, and have been successfully used to detect, control, and treat infections of humans and animals. As part of the Third Annual Meeting of the European Virus Bioinformatics Center (EVBC), we have published this Special Issue on Virus Bioinformatics.
