This is a practical guide to the use of simulation in pediatric training and evaluation, including all subspecialty areas. It covers scenario building, debriefing and feedback, and it discusses the use of simulation for different purposes: education, crisis resource management and interdisciplinary team training, competency assessment, patient safety and systems integration. Readers are introduced to the different simulation modalities and technologies and guided on the use of simulation with a variety of learners, including medical students, residents, practicing pediatricians, and health-related professionals. Separate chapters on each pediatric subspecialty provide practical advice and strategies to allow readers to integrate simulation into existing curriculum. Pediatric subspecialties covered include: General Pediatrics, Pediatric Emergency Medicine and Trauma, Neonatology, Pediatric Critical Care Medicine, Transport Medicine, Pediatric Anesthesia, and Pediatric Surgery amongst many others. Comprehensive Healthcare Simulation PEDIATRICS Edition is a volume in the series, Comprehensive Healthcare Simulation. The series is designed to complement Levine et al., eds., The Comprehensive Textbook of Healthcare Simulation by providing short, focused volumes on the use of simulation in a single specialty or on a specific simulation topic, and emphasizing practical considerations and guidance. This volume provides a practical overview of the ethical issues arising in pediatric practice. The case-based approach grounds the bioethical concepts in real-life

situations, covering a broad range of important and controversial topics, including informed consent, confidentiality, truthfulness and fidelity, ethical issues relating to perinatology and neonatology, end-of-life issues, new technologies, and problems of justice and public health in pediatrics. A dedicated section also addresses the topics of professionalism, including boundary issues, conflicts of interests and relationships with industry, ethical issues arising during training, and dealing with the impaired or unethical colleague. Each chapter contains a summary of the key issues covered and recommendations for approaching similar situations in other contexts. *Clinical Ethics in Pediatrics: A Case-Based Textbook* is an essential resource for all physicians who care for children, as well as medical educators, residents and scholars in clinical bioethics. Trusted by physicians and advanced practice providers through ten standard-setting editions, *Fanaroff and Martin's Neonatal-Perinatal Medicine, 11th Edition*, remains the reference of choice for expert, multidisciplinary guidance on the management and evidence-based treatment of problems in the mother, fetus, and neonate. An expanded team of international authors, led by Drs. Richard J. Martin, Avroy A. Fanaroff, and Michele C. Walsh of Rainbow Babies and Children's Hospital, brings you up to date with advances in the control of nosocomial infections in preterm infants, genetic disorders and birth defects, the fetal origins of adult disease, the late preterm infants, and much more – all designed to help you improve the quality of life and long-term outcomes of your patients. Remains the most comprehensive, multidisciplinary text in the field – an excellent source of information for every stage of your practice.

Operating theatres are very private workplaces. There have been few research investigations into how highly trained doctors and nurses work together to achieve safe and efficient anaesthesia and surgery. While there have been major advances in surgical and anaesthetic procedures, there are still significant risks for patients during operations and adverse events are not unknown. Due to rising concern about patient safety, surgeons and anaesthetists have looked for ways of minimising adverse events. Behavioural scientists have been encouraged by clinicians to bring research techniques used in other industries into the operating theatre in order to study the behaviour of surgeons, nurses and anaesthetists. Safer Surgery presents one of the first collections of studies designed to understand the factors influencing safe and efficient surgical, anaesthetic and nursing practice. The book is written by psychologists, surgeons and

anaesthetists, whose contributions combine to offer readers the latest research techniques and findings from some of the leading investigators in this field. It is designed for practitioners and researchers interested in understanding the behaviour of operating theatre team members, with a view to enhancing both training and practice. The material is also suitable for those studying behaviour in other areas of healthcare or in high-risk work settings. The aims of the book are to: a) present the latest research on the behaviour of operating theatre teams b) describe the techniques being used by psychologists and clinicians to study surgeons, anaesthetists and theatre nurses' task performance c) outline the safety implications of the research to date.

Since its inception in 1968, the brain-death criterion for human death has enjoyed the status of one of the few relatively well-settled issues in bioethics. However, over the last fifteen years or so, a growing number of experts in medicine, philosophy, and religion have come to regard brain death as an untenable criterion for the determination of death. Given that the debate about brain death has occupied a relatively small group of professionals, few are aware that brain death fails to correspond to any coherent biological or philosophical conception of death. This is significant, for if the brain-dead

are not dead, then the removal of their vital organs for transplantation is the direct cause of their deaths, and a violation of the Dead Donor Rule. This unique monograph synthesizes the social, legal, medical, religious, and philosophical problems inherent in current social policy allowing for organ donation under the brain-death criterion. In so doing, this bioethical appraisal offers a provocative investigation of the ethical quandaries inherent in the way transplantable organs are currently procured. Drawing together these multidisciplinary threads, this book advocates the abandonment of the brain-death criterion in light of its adverse failures, and concludes by laying the groundwork for a new policy of death in an effort to further the good of organ donation and transplantation.

This book addresses those aspects of anaesthetic practice in perioperative medicine which have a significant impact on both the immediate and the long-term outcome for the surgical patient. Perioperative Medicine is the natural evolution of anaesthesia from a main focus on the patient in the operating room to a responsibility for the care of the patient from the time that the decision to operate is made, through to discharge from hospital. The contributors, well-respected authors in their field, discuss the role of the perioperative medicine specialist in areas ranging from pre-operative assessment and physiological optimization via pre-habilitation, to intra-operative anaesthetic management, and post-operative care. Controversial topics discussed include fluid therapy, anaesthesia and cancer outcomes, pharmacological management of cardiac risk, and the evolution of acute to chronic pain. Developments in regional anaesthesia, quality of recovery scoring, and lung ultrasound, are described. It is hoped that the chapters contained in this book will help to define the nascent specialty that is Perioperative Medicine, and encourage further debate, research, and expansion of this vital new frontier in anaesthetic care.

This book focuses on the technical, cognitive, and behavioral skills needed to implement an extracorporeal membrane oxygenation (ECMO) simulation program. It describes these programs on the individual, team, and hospital system level, and

Rood en licht doorschijnend, als een pasgeboren konijntje. Onaf en perfect tegelijk. Zo beschrijft Brenda van Osch de eerste aanblik van haar dochter Eva, die in 2002 veel te vroeg werd geboren. Eva woog 680 gram, minder dan een pak suiker. In Het onvoltooide kind vertelt de auteur over de gebeurtenissen die volgen: de heftige maanden op de intensive care en de jaren daarna waarin langzaam duidelijk wordt hoeveel handicaps en problemen Eva heeft. Negen jaar later stapt Brenda van Osch opnieuw een afdeling neonatologie binnen - maar nu als journalist. De behandelgrens voor te vroeg geboren baby's is dan net verlaagd naar 24 weken. In het Academisch Medisch Centrum volgt ze enkele extreem vroeg geboren baby's en hun ouders en zit ze aan tafel als het artsenteam beslist over leven en dood. In indringende gesprekken met de betrokkenen stelt ze de vragen die ze na haar dochters geboorte niet stelde. Hoe ver willen artsen gaan om prille levens te redden? Moet alles gebeuren wat medisch mogelijk is? Ook gaat ze de confrontatie aan met Eva's dokter van toen en

met zichzelf. Is ze blij dat haar dochter nog leeft, of niet? In Nederland worden jaarlijks zo'n 2500 baby's veel te vroeg geboren. Het onvoltooide kind geeft op een unieke manier inzicht in de morele dilemma's rond leven en dood van deze kinderen.
