System Development: A Strategic Framework looks at one of the key issues in the design and development of IT systems: the fact that the bulk of system development projects

undertaken will fail to meet originally defined objectives. Using a number of case studies, it analyses the reasons for this poor performance and provides the reader with a pattern of well-defined failure mechanisms which are especially relevant to large, long-term projects. With these established, the book then generates a set of planning procedures and corporate guidelines which will substantially reduce the impact and probability of financial and performance disasters in future projects. Accessible to the professional and non-technical reader, this book will prove invaluable to project managers, development managers, IT controllers, project engineers, and systems analysts as well as MSc and MBA students studying computer system development.

Britain was the industrial and political powerhouse of the nineteenth century—the birthplace of the Industrial Revolution and the center of the largest empire of the time. With its broad imperial reach—and even broader indirect influence—Britain had a major impact on nineteenth-century material culture worldwide. Because British manufactured goods were widespread in British colonies and beyond, a more nuanced understanding of those goods can enhance the archaeological study of the people who used them far beyond Britain's shores. However, until recently archaeologists have given relatively little attention to such goods in Britain itself, thereby missing what is often revealing and useful contextual information for historical archaeologists working in countries where British goods were consumed while also leaving significant portions of Britain's own archaeological record poorly understood. *The Importance of British Material Culture to Historical Archaeologies of the Nineteenth Century* helps fill these gaps, through case studies demonstrating the importance and meaning of mass-produced material culture in Britain from the birth of the Industrial Revolution (mid-1700s) to early World War II. By

examining many disparate items—such as ceramics made for export, various goods related to food culture, Scottish land documents, and artifacts of death—these studies enrich both an understanding of Britain itself and the many places it influenced during the height of its international power.

Biological and biomedical research are increasingly driven by experimental techniques that challenge our ability to analyse, process and extract meaningful knowledge from the underlying data. The impressive

capabilities of next generation sequencing technologies, together with novel and ever evolving distinct types of omics data technologies, have put an increasingly complex set of challenges for the growing fields of Bioinformatics and Computational Biology. The analysis of the datasets produced and their integration call for new algorithms and approaches from fields such as Databases, Statistics, Data Mining, Machine Learning, Optimization, Computer Science and Artificial Intelligence. Clearly, Biology is more and more a science of information requiring tools from the computational sciences. In the last few years, we have seen the surge of a new generation of interdisciplinary scientists that have a strong background in the biological and computational sciences. In this context, the interaction of researchers from different scientific fields is, more than ever, of foremost importance boosting the research efforts in the field and contributing to the education of a new generation of Bioinformatics scientists. PACBB'14 contributes to this effort promoting this fruitful interaction. PACBB'14 technical program included 34 papers spanning many different sub-fields in Bioinformatics and Computational Biology. Therefore, the conference promotes the interaction of scientists from diverse research groups and with a distinct background such as computer scientists, mathematicians or biologists.
